Patent No. 5759542
GENERAL INFORMATION:
APPLICANT: Victor Gurewich
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE DELIVERY
TITLE OF INVENTION: OF DRUGS BY PLATELETS FOR THE TREATMENT OF
TITLE OF INVENTION: ARDIOVASCULAR AND OTHER DISEASES
NUMBER OF SEQUENCES: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 411;

Sequence 47, Application US/08560098A
Patent No. 5976841
GENERAL INFORMATION:
APPLICANT: WNENDY, Stephan
APPLICANT: HEINZEL-WIELAND, Regina
APPLICANT: STEPFENS, Gard Josef
TITLE OF INVENTION: Proteins having Fibrinolytic and
TITLE OF INVENTION: Coagulation-inhibiting Properties
NUMBER OF SEQUENCES: 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 48, Application US/08560098A
Patent No. 5976841
GENERAL INFORMATION:
APPLICANT: WISHOL.
APPLICANT: STEFFENS, Gerd Josef
TITLE OF INVENTION: Proteins having Fibrinolytic and
TITLE OF INVENTION: Coagulation-inhibiting Properties
NUMBER OF SEQUENCES: 60
CORRESPONDENCE ADDRESS:
Patent No. 5219569
, APPLICANT: BLABER, MICHAEL;HEYNEKER, HERBERT L.;VEHAR,

                                                                                                                                                                                                                                                                                                                                                                                Urokinase precursor-lipid composite - used as thrombolytic agent, having prolonged half-life in the blood, enhanced bio:availability and improved activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      By forming a precursor-lipid composite, the half-life of this thrombolytic agent in the blood may be increaced, exhibiting improved activity without abnormal acceleration of fibrinolytic activity. Compound is useful as a thrombolytic agent in treatment of cerebral thrombosis, myocardial infarction etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                       Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular wie, 50,000) and L (molecular wie, 20,000) and L (molecular wie, 20,000) chains when treated with catalytic amounts of plasmin. The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It is a thrombolytic agent which manifests its plasminogen activator activity on cleavage by proteolytic enzymes (e.g. plasmin) and has higher affinity for fibrin than known forms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                        Zymogen AAP50871 is the inactive precursor form of human urokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 411;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VCSLQGRMTLTGIVSWGRGCALKDKPGVYTRVSHFLPWIRSHTKEENGLAL

Cyclic peptides based on the amino acids residues 20-30 (the receptor-binding region) of uPA are claimed. These cyclic peptides target the uPA receptor (uPAR), allowing therapeutic or diagnostic agents to be delivered to uPAR-expressing cells. The cyclic peptides are used, optionally when linked to a therapeutic agent, to inhibit migration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-terminal; pro-uPA; urokinase plasminogen activator; receptor; uPAR; anti-cancer, atti-medsatatic; anti-proliferative; anti-atherosclerotic; anti-thrombotic; anti-angiogenic; anti-inflammatory; anti-arthritic; anti-fibrotic; apoptotic; vasotropic; anti-diabetic; ophthalmological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 2301; DB 16; Length 411; 100.0%; Pred. ```
invasion and proliferation of cells, or angiogenesis, or to induce apoptosis. Particularly they are used, in human or veterinary medicine, to tread diseases characterized by these processes, e.g. solid tumors, leukaemia or lymphoma (or their metastases); benigh hyperplasis; atherosclerosis; restenosis; ischaemia; deep vein thrombosis; neovascular glaucoma; diabetic retinopathy; arthritis; fibrosis; bone fracture etc., most particularly growth, invasion and metastasis of tumors. When cyclic peptides can be used for diagnostic detection of upAR american immediate they are used to isolate uPAR or cells that express them. The cyclic peptides can etlls, tissues etc., in vivo or in vitro, and when immobilized they are used to isolate uPAR or cells that express them. The cyclic peptides are stable, soluble in water, bind strongly to attachment of therapeutic or diagnostic agents without significantly affecting their binding. Since they target uPAR, they should have grelatively low systemic toxicity and only low doses are required.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         KASTDIMGRPCLPWNSATVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microrangiopathies, surgically induced thrombotic disorders, angiogenic disorders, upulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glancoma, disorder, unchinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary by hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinasetype plasminogen activator (uPA) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
